

## Bauer Bandage Study

**Table no. 3 Overall assessment by the doctor by groups**

Group	Suitability of Bauer Bandage application	Comments
I.	very suitable	for all types of ulceration, regardless the etiology
II.	suitable	in one half of cases healing of defects, in the remaining cases a clear healing trend with expected successful termination, poor granulation changed into live granulation very fast
III.	possible and suitable	patients forming quite an exception in the study, despite the fact a therapeutic effect was not expected results promising – cleaning of the bottom, start of granulation, patients appreciated mainly elimination of foetor and pain reduction
IV.	very effective	total healing of defects reached after preceding two-month traditional treatment
V.	suitable (after initial elimination of crusts)	in the monitored group solely gypsy patients, very undisciplined, despite that fact total healing after 6 – 8 weeks, interruption of application because of undisciplined behaviour
VI.	very suitable	excellent results
VII.	after considering of other therapeutic options, especially in case of inoperable states, use of ACATEX as an accessory treatment suitable	therapeutic effect was not expected and awaited in relation to epithelialisation and healing, rather analgesic effect, partial cleaning of the bottom and elimination of foetor. That expectation was fulfilled.
